COMP 303

Computer Architecture

Lecture 1

---

Roy Kucukates

# Introduction

- This course is all about how computers work
- But what do we mean by a computer?
  - Different types: desktop, servers, embedded devices
  - Different uses: automobiles, graphics, finance, genomics...
  - Different manufacturers: Intel, Apple, IBM, Microsoft, Sun...
  - Different underlying technologies and different costs!

# Introduction

- Analogy: Consider a course on “automotive vehicles”
  - Many similarities from vehicle to vehicle (e.g., wheels)
  - Huge differences from vehicle to vehicle (e.g., gas vs. electric)
- Best way to learn:
  - Focus on a specific instance and learn how it works
  - While learning general principles and historical perspectives

# Classes of Computing Apps.

- Desktop computers
- Servers
- Super computers
- Embedded computers

---

# What to learn

- How are programs written in a high-level language, translated into the language of the hardware
- What is **the interface between the software and the hardware**, and how does software instruct the hardware to perform needed function
- What determines the **performance of a program**
- What techniques can be used by **hardware designers to improve performance**

# Performance

- Both Hardware and Software affect performance:
  - Algorithm determines number of source-level statements
  - Language/Compiler/Architecture determine machine instructions  
(Chapter 2 and 3)
  - Processor/Memory determine how fast instructions are executed  
(Chapter 5, 6, and 7)

# Below the application

# What is a computer?

- Components:

- ❑ input (mouse, keyboard)
- ❑ output (display, printer)
- ❑ memory (disk drives, DRAM, SRAM, CD)
- ❑ network

- Our primary focus: the processor (datapath and control)

- ❑ implemented using millions of transistors
- ❑ Impossible to understand by looking at each transistor

# Abstraction

High-level  
language  
program  
(in C)

```
swap(int v[], int k)
{
    int temp;
    temp = v[k];
    v[k] = v[k+1];
    v[k+1] = temp;
}
```

Compiler

Assembly  
language  
program  
(for MIPS)

```
swap:
    null $2, $5, 4
    add  $2, $4, $2
    lw   $15, 0($2)
    lw   $16, 4($2)
    sw   $16, 0($2)
    sw   $15, 4($2)
    jr   $31
```

Assembler

Binary machine  
language  
program  
(for MIPS)

```
000000001010000110000000000011000
000000000000110000001100000100001
10001100011000100000000000000000
100011001111001000000000000000100
10101100111100100000000000000000
101011000110001000000000000000100
000000111110000000000000000001000
```

# How do computers work?

- Need to understand abstractions such as:
  - ❑ Applications software
  - ❑ Systems software
  - ❑ Assembly Language
  - ❑ Machine Language
  - ❑ Architectural Issues: i.e., Caches, Virtual Memory, Pipelining
  - ❑ Sequential logic, finite state machines
  - ❑ Combinational logic, arithmetic circuits
  - ❑ Boolean logic, 1s and 0s
  - ❑ Transistors used to build logic gates (CMOS)
  - ❑ Semiconductors/Silicon used to build transistors
  - ~~❑ Properties of atoms, electrons, and quantum dynamics~~

# Instruction Set Architecture

## ■ A very important abstraction

- ❑ interface between hardware and low-level software
- ❑ standardizes instructions, machine language bit patterns, etc.
- ❑ advantage: *different implementations of the same architecture*
- ❑ disadvantage: *sometimes prevents using new innovations*

*True or False: Binary compatibility is extraordinarily important?*

## ■ Modern instruction set architectures:

- ❑ IA-32, PowerPC, MIPS, SPARC, ARM, and others

---

# Historical Perspective

- ENIAC built in World War II was the first general purpose computer
  - ❑ Used for computing artillery firing tables
  - ❑ 80 feet long by 8.5 feet high and several feet wide
  - ❑ Each of the twenty 10 digit registers was 2 feet long
  - ❑ Used 18,000 vacuum tubes
  - ❑ Performed 1900 additions per second

# Eniac

–Since then:

**Moore's Law:**

**transistor capacity doubles  
every 18-24 months**

---

# Reading Assignment

- Read Ch 1. Especially 1.4 Performance
